

PATIENT

Marcus Osowski

PRESENTING CLINICAL SIGNS

Last normal 2 days prior. V+ of bile on floor w 2 cat treats in it. Yesterday seemingly normal. Today when trying to feeding breakfast then V+ up bile. Eats Ceasar and Gravy Train and chicken meat. Otherwise normal behaviors.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right lateral and ventrodorsal views of the abdomen totaling 2 images available for review.

BREED

Rat Terrier Mix

RADIOGRAPHIC FINDINGS

The patient is mildly obese.

The abdominal cavity is voluminous.

SEX

The abdominal serosal detail appears to be maintained.

M

No abnormalities of the spleen and kidneys are noted.

AGE

13 Years

Moderate generalized enlargement of the liver with slightly rounded lobar margins is seen.

The stomach is empty except for a mild amount of gas.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The small intestinal loops are evenly distributed throughout the mid abdomen with no evidence of abnormal dilation. They are mildly turgid in appearance.

The colon contains a mild amount of fecal matter and a moderate amount of gas.

RADIOGRAPHIC DIAGNOSIS

- Moderate hepatomegaly.
- Gastrointestinal maldigestion pattern.

HOSPITAL NAME

Blandford Animal
Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Differential diagnosis for the hepatomegaly includes endocrine and metabolic hepatopathy. Diffuse inflammatory/infectious or neoplastic infiltrates cannot be ruled out but are less likely. Correlate with the laboratory values and consider further definition by means of ultrasound with eventual sampling if indicated.

REFERRING VET

Lapierre

The gastrointestinal maldigestion pattern is a nonspecific finding. There is no direct evidence of mechanical ileus. Functional and subileus, however, remain a potential and full internal medicine workup as well as full abdominal ultrasound should be considered for further definition in case of persisting clinical signs.
