SPECIES

Feline

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views of the abdomen totaling 4 images available for review.

BREED

DSH

RADIOGRAPHIC FINDINGS

Lumbosacral vertebral end plate sclerosis and spondylosis deformans is seen. There are also spondyloses between L1/2 and L2/3.

SEX

Spayed Female

The patient is in thin body condition.

The abdominal serosal detail appears to be within normal limits.

The gastrointestinal tract is postprandial and presents within normal limits.

AGE

17 Years

Small mineral opaque foci superimpose onto the renal pelvis area of both kidneys.

The urinary bladder is small, and no abnormal opacities are seen.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The radiographic presentation of the liver is considered within normal limits.

RADIOGRAPHIC DIAGNOSIS

- Bilateral hypercalcemic nephropathy.
- Multiple spondyloses – likely unrelated to the reason of presentation.

HOSPITAL NAME

Truscott Animal
Hospital

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic findings suggest potential for chronic hypercalcemic nephropathy. The remainder of the abdominal organs present within the expected limits. No evidence of organomegaly or a mass effect is seen.
