RADIOGRAPHIC FINDINGS**Left Stifle**

Patient has a history of left sided extracapsular cruciate ligament repair with two drill holes being seen in the tibial tuberosity.

SEX

MN

Moderate periarticular osteophytes are present and there is moderate articular swelling.

AGE

6 Years

The tibia presents mild cranial thrust with respect to the femoral condyles.

Moderately reduced volume of the left hind limb musculature is seen.

Right Stifle

Mild articular swelling of the right stifle joint is seen.

INTERPRETED BYNele Eley, DVM
Dr. med. Vet. DipECVDI

No definitive cranial thrust of the tibia can be noted, and minimal periarticular osteophytes are present in the femoral trochlea.

RADIOGRAPHIC DIAGNOSIS

- History of left sided cruciate ligament repair with moderate osteoarthritic changes of the left stifle.
- Mild articular swelling of the right stifle.
- Disuse atrophy of the left hind limb musculature.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic presentation of the right stifle reveals mild articular swelling which may represent effusion, swelling of the synovium, or a combination of these. Degenerative, traumatic, and inflammatory arthropathy are theoretical potentials. With the history of positive drawer sign, cranial cruciate ligament failure is considered likely along with early osteoarthritis.
