Crash David

PRESENTING CLINICAL SIGNS

History of intermittent forelimb lameness over the last few weeks. No history of trauma. No current medications. On PE today - pronounced left forelimb lameness noted. Pain/resistance to range of motion of left elbow. Elbow also palpates thickened. Unable to get good positioning of forelimbs for Cranial/Caudal view due to pain. Significant changes found in right shoulder.

SPECIES

Feline

RADIOGRAPHIC STUDY OF THE ELBOWS

Mediolateral and craniocaudal views of both elbows totaling 3 images available for review.

BREED

DSH

RADIOGRAPHIC FINDINGS

The right elbow presents within normal age related limits.

SEX

MN

Isolated osseous structures are seen cranial to the proximal radius and distal to the lateral and medial humeral epicondyle in the left elbow. The periarticular bone presents moderate remodeling. A smooth osteophyte is seen on the proximal contour of the anconeus process.

AGE

8 Years, 9 Months

The right shoulder is included in the craniocaudal view of the elbows and reveals asymmetric joint space collapse, subchondral and periarticular bone remodeling with new bone formation. Assessment is limited to the availability of an oblique view.

RADIOGRAPHIC DIAGNOSIS

- Left elbow osteoarthritis with evidence of flexor and extensor enthesopathy.
- Normal age related right elbow.
- Arthropathy of the right shoulder.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Osteoarthritic changes, flexor, and extensor enthesopathy are present in the left elbow which may correlate with the history of left front limb lameness.

HOSPITAL NAME

Gentle Doctor Animal
Hospital

Note the presence of osseous changes in the right shoulder and consider orthogonal views centering the right shoulder for further definition should this be of clinical interest.
