

PATIENT PRESENTING CLINICAL SIGNS

Tula McCoy 3 month history of LR lameness
 Abnormal PE/Chem/CBC/UA Results: Exam: L Knee extension pain Left cranial drawer Right knee normal

SPECIES ULTRASONOGRAPHIC STUDY OF THE BILATERAL STIFLES

Canine There may be a mix up of the labeling since the labeling of the subsequent loops goes back between the right and left side repeatedly.

BREED ULTRASONOGRAPHIC FINDINGS

Lab Retriever **Left Stifle**

SEX
 FS
AGE
 8.3 Years

No abnormal effusion is seen within the supra- and infra patellar area. There is no evidence of synovial or capsular thickening or proliferation. The cranial cruciate ligament appears to be continuous and well-delineated, no deviation from normal echoarchitecture is noted. Lateral and medial menisci are within their anticipated positions and align well below the bone surfaces, meniscal surfaces are even and smooth. The echotexture is hypo echoic and uniform. The joint margins are smooth, no osteophytes are seen. The infra patellar fat pad present, the expected echo architecture.

Right Stifle

No abnormal effusion is seen within the supra- and infra patellar area. There is no evidence of synovial or capsular thickening or proliferation. The cranial cruciate ligament appears to be continuous and well-delineated, no deviation from normal echoarchitecture is noted. Lateral and medial menisci are within their anticipated positions and align well below the bone surfaces, meniscal surfaces are even and smooth. The echotexture is hypo echoic and uniform. The joint margins are smooth, no osteophytes are seen. The infra patellar fat pad present, the expected echo architecture.

ULTRASONOGRAPHIC DIAGNOSIS

- No ultrasonographic evidence of stifle arthropathy.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

REFERRING VET

James Gaynor

The ultrasonographic presentation of the cruciate ligaments and visible parts of the menisci is within normal limits. Cruciate ligament edema cannot be ruled out entirely; however, no significant effusion, synovialitis, or osteoarthritic changes are seen in the visible parts of the bilateral stifle joints.
