

PATIENT

Logan Horgan

PRESENTING CLINICAL SIGNS

came today for being constipated , lethargic , panting
Abnormal PE/Chem/CBC/UA Results: moderate abdominal distention and pain during palpation, bloodwork revealed to slightly dehydration, abnormal SNAP CPLI , , Xray sent to evaluate abdomen and thorax.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

Lateral and ventrodorsal views of the abdomen and thorax totaling 5 images available for review in jpeg format.

BREED

Welsh Corgi

Only jpg images were submitted. The transformation from DICOM to jpg only allows for limited manipulation of the image. For the best possible results, we suggest submitting DICOM images in the future. Please do not hesitate to contact us should you need any help with the submission process.

SEX

Male Neutered

RADIOGRAPHIC FINDINGS

Thorax

The surrounding bony structures are within normal limits.

AGE

5 Years

The extrathoracic soft tissues present homogeneous without abnormalities.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The heart is of normal size and shape and there is no evidence of cardiac chamber or vascular enlargement. Normal radiographic presentation of the cardiac silhouette. The pulmonary vasculature is within normal limits.

The cranial mediastinum presents the expected soft tissue opacity. No evidence of abnormal mediastinal widening is seen.

HOSPITAL NAME

Lakeshore Woods
Animal Hospital

Course and width of the trachea are considered within normal limits. There appears to be mild redundancy of the dorsal tracheal ligament cranial to the thoracic inlet.

The degree of pulmonary inflation is fair. A mild generalized bronchointerstitial lung pattern, which may be enhanced by the poor degree of pulmonary inflation, is seen.

REFERRING VET

Dr. Sam Masoud

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

Abdomen

INVOICE

52785

Moderate gastric aerophagia is seen.

The liver margins extend beyond the limit of the ribcage.

DATE

7-9-22

A moderate amount of gas is seen within the small intestine. There is no evidence of abnormal dilation, plication, or radiopaque foreign material for the small intestine.

Mild dilation of the descending colon and a large amount of inspissated fecal matter are seen

PATIENT within the descending colon and rectum.

Logan Horgan Mineralization of the intervertebral disc L2/3 is noted.

RADIOGRAPHIC DIAGNOSIS

- SPECIES**
- Constipation.
 - Gastrointestinal aerophagia.
 - Mild hepatomegaly.
- Canine

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

BREED Moderate constipation and mild dilation of the colon are noted.

Welsh Corgi

There is no radiographic evidence of a mass effect in the caudal abdomen or pelvic canal.

SEX The gastrointestinal aerophagia may be due to excitement, pain, or less likely, related to respiratory distress.

Male Neutered

AGE Differential diagnosis for the mild hepatomegaly include age related degeneration, metabolic/endocrine hepatopathy, and inflammatory or neoplastic infiltrative pathology. Correlate with the laboratory values and consider ultrasound for further definition if indicated.
