

**PATIENT**

EB Stubbs Thomas

**PRESENTING CLINICAL SIGNS**

Presented yesterday for vomiting and diarrhea. Temp 103.7 at that time. Treated for gastroenteritis using cerenia and metronidazole. SQ fluids were administered. Presented again today for increased panting and sluggishness. Still having diarrhea. NO vomiting. Temp 103.4 today.

**SPECIES**

Canine

Abnormal PE/Chem/CBC/UA Results: CBC - mild leukocytosis with neutrophilia and lymphopenia Chem - unremarkable

**BREED**

English Bulldog

**RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN**

Lateral and ventrodorsal views of the abdomen and right/left lateral and ventrodorsal views of the thorax totaling 5 images available for review in jpeg format.

**RADIOGRAPHIC FINDINGS**

**SEX**

MN

**Abdomen**

Multiple moderate to severe spondyloses are seen throughout the thoracolumbar junction and lumbar spine as well as the lumbosacral junction.

**AGE**

11 Years

Moderate bilateral stifle osteoarthritis is seen.

There appears to be mildly reduced abdominal serosal detail in the region of and caudal of the stomach.

**INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

The small intestinal loops are evenly distributed throughout the mid abdomen. They are turgid in appearance and present a gas pattern. However, no evidence of abnormal dilation, plication, or foreign material is seen.

**HOSPITAL NAME**

Torch Lake  
Veterinary Clinic

An ovoid soft tissue opacity is seen within the center of the abdominal cavity, and it is unclear whether this represents the left kidney which appears to be in a caudal position in the orthogonal view as well. The right kidney is seen in its anticipated position.

**Thorax**

T5/6 and T6/7 spondyloses are seen as well as caudal thoracic spondyloses.

**REFERRING VET**

Adrienne Waffle

There is no radiographic evidence of cardiovascular pathology.

There is no evidence of mediastinal widening.

**INVOICE**

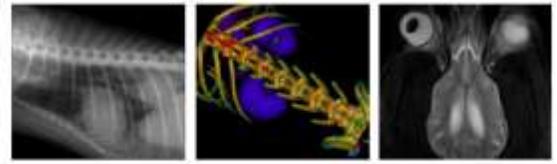

46932

The degree of pulmonary inflation is fair. A moderate generalized bronchointerstitial lung pattern with peribronchial interstitial infiltrates is seen. No evidence of interstitial pulmonary nodules or masses is noted.

No evidence of tracheal hypoplasia is noted.

**DATE**

8-10-21

**PATIENT**

EB Stubbs Thomas

**RADIOGRAPHIC DIAGNOSIS**

- Regionally reduced serosal detail in the cranial abdomen.
- Gastrointestinal maldigestion pattern.
- Relative caudal and ventral position of the left kidney.
- Multiple normal age and breed related lung.
- No radiographic evidence of cardiovascular pathology.
- Multiple spondyloses.
- Bilateral stifle osteoarthritis.

**SPECIES**

Canine

**BREED**

English Bulldog

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The reduced serosal detail may be secondary to regional peritonitis including pancreatitis or other pancreatopathy as well as secondary to crowding of the gastrointestinal tract. A gastrointestinal maldigestion pattern is noted which correlates with the clinical history of the patient; however, is an unspecific radiographic sign with multiple potential underlying causes. No evidence of mechanical ileus is seen radiographically. Consider further definition by means of ultrasound in order to obtain more detailed information about the gastrointestinal tract's wall, layering, content, and motility as well as the associated organs and to further verify the radiographically reduced serosal detail in the cranial abdomen.
