

**PATIENT**

Harley Wygodny

PRESENTING CLINICAL SIGNS

6 months history of clear nasal discharge

SPECIES

Canine

COMPUTED TOMOGRAPHIC STUDY OF THE HEAD

Plain and post contrast studies available for review in soft tissue and bone reconstructions.

BREED

Goldendoodle

COMPUTED TOMOGRAPHIC FINDINGS

The pictured parts of the dentition are complete and unremarkable in all jaw quadrants.

The nasal cavity presents the expected aerated spaces between thin & even conchae and turbinates with smooth mucosal lining.

SEX

MN

Both temporomandibular joints present congruent joint spaces with even subchondral bone surfaces and are considered within normal limits.

The tympanic bullae are aerated, the mucosal lining is not seen, and the bony wall is smooth and thin. The external ear canals are within normal limits.

AGE

5 Years

The brain presents no deviation from normal anatomy and symmetry. The brain parenchyma is homogeneous and within normal limits for attenuation and distribution of contrast enhancement. The ventricular system is non-dilated and symmetric.

INTERPRETED BYNele Eley, DVM
Dr. med. Vet. DipECVDI

The submandibular and medial retropharyngeal lymph nodes are small and elongated with a normal short-to-long-axis-ratio of < 0.5. The attenuation and contrast enhancement pattern are uniform.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Structurally normal CT study of the nasal cavities and paranasal sinuses.

HOSPITAL NAMEAnimal Health
Partners**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

No evidence of nasal foreign material, mass lesion, or turbinate destruction is seen on the CT study of the nasal cavities. The paranasal sinuses present within normal limits. Nondestructive rhinitis such as irritant/allergic rhinitis and mild infectious rhinitis including viral, bacterial, and less likely parasitic however, are a potential. Further definition by means of endoscopy with sampling could be considered, if not performed already, in order to rule out infectious disease.
