RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

BREED

DSH

Right/left lateral and ventrodorsal whole body views totaling 3 images available for review.

RADIOGRAPHIC FINDINGS

SEX

SF

Thorax

The surrounding bony structures are within normal limits.

The extrathoracic soft tissues present homogeneous without abnormalities.

AGE

4 Years

The heart is of normal size and shape and there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

HOSPITAL NAME

Golden Isles Animal
Hospital

A moderate generalized bronchial lung pattern with marked peribronchial cuffing accentuating the caudodorsal lung field is seen.

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

REFERRING VET

James Hornbuckle

Abdomen

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

INVOICE

46999

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

DATE

8-17-21

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic tail is not seen.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary

**PATIENT**

bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

Bodhi Altman

The stomach is empty except for a mild amount of gas.

SPECIES

The small intestinal loops are evenly distributed throughout the mid abdomen without evidence of abnormal dilation or plication. The small intestinal loops are turgid in appearance with reduced signs of peristaltic segmentation.

Feline

The colon is largely empty.

BREED**RADIOGRAPHIC DIAGNOSIS**

DSH

- Active lower airway pattern.
- Gastrointestinal maldigestion pattern.

SEX**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

SF

The radiographic findings of the thorax suggest potential for active lower airway inflammation or infection. Infectious bronchitis such as viral, bacterial, parasitic, or protozoal is a potential as well as feline allergic lower airway syndrome with active inflammation or superinfection. Consider further definition by means of airway sampling versus a clinical trial of treatment for infectious and allergic bronchitis. The possibility of upper airway involvement should be considered.

AGE

4 Years

The abdominal changes are unspecific. No evidence of mechanical ileus is seen. Further definition by means of ultrasound appears to be indicated in case of persisting or recurring clinical signs only.
