

PATIENT

Duke Darrow

PRESENTING CLINICAL SIGNS

falling over in the yard (not having seizures) while having a bowel movement and unable to stand after. hx of heart murmur, intermittent cough, occasionally vomits water, panting more but unknown if it is because he is hot due to summer. Started 3 weeks ago.

SPECIES

Canine

Abnormal PE/Chem/CBC/UA Results: Abdomen - MILD FILL BUT Soft
Cardiovascular/Respiratory CARDIAC MURMUR, 3/6 HOLOSYSTOLIC, HIGH ON LEFT SIDE
PMI HR: 160 BPM SCLEROSIS NORMAL FOR AGE. LONG NAILS REAR PARESIS: DELAYED
FLIP ON TOES STAGE III DENTAL DISEASE DOWN 2.4# SINCE APRIL Blood Pressure Readings:
115 @ 11:18, 115 @ 11:20, 120 @ 11:23. Average BP reading 130

BREED

Border Collie

RADIOGRAPHIC STUDY OF THE THORAX

Right/left lateral and ventrodorsal views of the thorax totaling 3 images available for review.

SEX

Neutered

RADIOGRAPHIC FINDINGS

Mildly progressive left sided cardiomegaly with a vertebral heart score of 11.2 is noted. There is moderate basico-apical enlargement of the cardiac silhouette with mild tracheal elevation and left atrial tenting with loss of the caudal cardiac waist. No evidence of a vascular lung pattern is noted.

AGE

11 Years, 11 Months

There is a mild generalized very well structured bronchointerstitial lung pattern. No evidence of pulmonary nodules or masses is seen.

There is no evidence of esophageal dilation.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

Course and width of the trachea are considered within normal limits.

No evidence of mediastinal widening is noted.

HOSPITAL NAME

Elizabeth Animal
Hospital

Early spondylosis deformans is noted in the mid thoracic spine.

Both shoulder joints present mild osteoarthritic changes.

REFERRING VET

Leon Anderson, DVM

RADIOGRAPHIC DIAGNOSIS

- Mildly progressive left sided cardiomegaly with no radiographic evidence of congestive heart failure.
- Mild generalized bronchointerstitial lung pattern.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

INVOICE

53533

Minimal progression of the cardiomegaly is noted radiographically with the vertebral heart score progressive from 11 to 11.2. Part of this may depend on the cardiac cycle. At this time, there is no evidence of congestive heart failure or congestion of the pulmonary vessels.

DATE

8-17-22

The bronchointerstitial lung pattern is mild and stationary and may well be within age related normal limits.

Consider neurologic, systemic/metabolic, and cardiac arrhythmia as potential causes of the "collapsing" signs.
