
PATIENT PRESENTING CLINICAL SIGNS

Cody Frank Left liver lobe mass, cavitated. Thoracic rads no evidence of metastasis.

COMPUTED TOMOGRAPHIC STUDY OF THE ABDOMEN
SPECIES

Plain and post-contrast studies available for review.

Canine

COMPUTED TOMOGRAPHIC FINDINGS
BREED

German Shepherd

A large, cavitated mass is emerging from the left division of the liver. The mass measures approximately 8.5 cm x 7.5 cm x 6.5 cm. Multifocal intralesional cavitation with contrast sparing fluid attenuating areas is seen. The mass extends caudally from the left division of the liver, origin appears to be from the left lateral liver lobe. The remainder of the liver presents within age related normal limits.

SEX

Neutered Male

The gallbladder is severely distended with uniformly fluid attenuating content.

Moderate dilation of the stomach with fluid is seen.

The spleen is absent. Stapler clamps are seen in the position of the splenic hilus.

AGE

12 Years 3 Months

The abdominal lymph node present within normal limits.

Up to 7.0 mm sized cortical renal cysts are seen within both kidneys.

Mild lumbosacral disc protrusion with moderate spondylosis deformans is seen.

INTERPRETED BY

Nele Eley (Ondreka),
 DVM Dr. med. vet.,
 DipECVDI

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Large, cavitated, expansile left divisional liver mass meeting neoplastic criteria
- History of splenectomy
- Small cortical renal cysts
- Distended gallbladder
- Distended stomach

INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS
REFERRING VET

Dr. Ciruta

The CT study reveals a cavitated left divisional liver mass. Lobar origin from the left lateral liver lobe is considered most likely. Differential diagnosis includes hepatoma, hepatocellular carcinoma, adenoma, and less likely nodular hyperplasia or metastasis. The mass is in a resectable position. Final diagnosis will require histology. No evidence of abdominal metastases seen at the time of the CT examination.
