

PATIENT

Snafu Sobschak

PRESENTING CLINICAL SIGNS

Not eating for 5 days; owner noticed a string coming out during vomiting. Lethargic, dehydrated
 Abnormal PE/Chem/CBC/UA Results: moderate dehydration & moderate abdominal distension noticed during palpation mild hypokalemia & mild hyperglycemia; rest unremarkable, including pancreatitis

SPECIES

Feline

RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

Right/left lateral and ventrodorsal whole body views totaling 3 images available for review.

BREED

Domestic Shorthair

RADIOGRAPHIC FINDINGS

Abdomen

The abdominal serosal detail is maintained.

SEX

Male Neuter

The kidneys, liver, and urinary bladder present within normal limits.

AGE

8 Years

A mild amount of fluid and a moderate amount of gas appear to be present within the stomach. No radiopaque foreign material is seen.

The small intestinal loops present no evidence of abnormal dilation. A segmental gas pattern is noted. No evidence of plication of the small intestine is seen.

INTERPRETED BY

Nele Eley, DVM
 Dr. med. Vet. DipECVDI

The colon contains a mild amount of fecal matter.

Thorax

Mild dilation of the precranial thoracic esophagus with gas is noted.

HOSPITAL NAME

St. Catherine's Animal Hospital

The lungs are poorly inflated. A mild generalized bronchointerstitial lung pattern is noted.

Course and width of the trachea are considered within normal limits.

There is no radiographic evidence of cardiovascular pathology.

REFERRING VET

Dr. Masoud

RADIOGRAPHIC DIAGNOSIS

- Gastrointestinal maldigestion pattern.
- Mild esophageal aerophagia.
- Mild bronchointerstitial lung pattern.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

DATE

8-23-22

The radiographic study reveals no evidence of small intestinal plication or dilation. Technically, a small or linear intestinal foreign object cannot be ruled out entirely, however, there is radiographic evidence of it. Ultrasound of the abdomen could be considered for further definition in case of persisting clinical signs. The radiographic findings suggest presence of functional rather than mechanical ileus.

PATIENT

Snafu Sobschak

The esophageal aerophagia may be due to swallowing of air in conjunction with excitement or pain. Esophageal dysmotility cannot be ruled out.

SPECIES

Feline

The mild generalized bronchointerstitial lung pattern is not necessarily of clinical significance. Presence of lower airway disease such as allergic lower airway syndrome or infectious bronchitis, however, cannot be ruled out entirely.

BREED

Domestic Shorthair
