

**PATIENT**

Mocha Blanton

**PRESENTING CLINICAL SIGNS**

Patient presented for not using LH leg for the past few days, owner states that pet jumped off the bed and has now been non weight bearing. No cranial drawer present and no tibial thrust  
Abnormal PE/Chem/CBC/UA Results: Painful on caudal extension of left hip

**SPECIES**

Canine

**RADIOGRAPHIC STUDY OF THE STIFLES & PELVIS**

Mediolateral views of both stifles and ventrodorsal views of the pelvis totaling 5 images available for review.

**BREED**

Chihuahua Mix

**RADIOGRAPHIC FINDINGS****Stifles****SEX**

The patellae are in situ in all available images. There is no evidence of articular swelling, osteoarthritis, or subchondral bone defects in either of the stifle joints.

**MN**

The position of the tibia and popliteal sesamoid bone is considered within normal limits in both hind limbs.

**AGE**

7.5 Years

No evidence of muscle atrophy is noted.

**Pelvis****INTERPRETED BY**

Nele Eley, DVM  
Dr. med. Vet. DipECVDI

The radiographic presentation of the pelvic bones and coxofemoral joints is within normal limits. There is no evidence of dysplasia, osteoarthritis, or traumatic osseous injury.

**RADIOGRAPHIC DIAGNOSIS**

- Radiographically normal stifles and coxofemoral joints.

**HOSPITAL NAME**

Boca Park Animal  
Hospital

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The source of the clinical signs remains unclear. The radiographic presentation of the stifles and coxofemoral joints is within normal limits and bilaterally symmetric. Consider soft tissue trauma or inflammation as well as neurologic disease as potential sources of the clinical signs.
