PRESENTING CLINICAL SIGNS

follow up x-rays after a history of feline asthma diagnosed on August 14 at Cavan Hills Vet services. On prednisolone 50 mg/ml, 0.15 ml PO q24. Doing much better.
Abnormal PE/Chem/CBC/UA Results: No chest crackles or wheezes. Normal heart sound.
Previous blood work, showed hyperglycemia.

RADIOGRAPHIC STUDY OF THE THORAX

Right/left lateral and ventrodorsal views of the thorax totaling 3 images available for review.

RADIOGRAPHIC FINDINGS

The lungs are moderately inflated. A mild generalized bronchial lung pattern is seen and evenly distributed throughout the entire lung field. There is no radiographic evidence of air trapping.

The mediastinum presents within normal limits.

No abnormality of the cardiac silhouette is seen.

The thoracic boundaries present within normal limits.

RADIOGRAPHIC DIAGNOSIS

- Mild generalized bronchial lung pattern.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The mild generalized bronchial lung pattern showing radiographically is compatible with the history of allergic lower airway syndrome. At this time, no evidence of complication such as bronchiectasis, bronchial mucus plugging, lobar atelectasis, or other are seen radiographically. No evidence of cardiovascular pathology is seen. Continuation of the treatment regime and further clinical monitoring are advised.
