

PATIENT

Dusty Sharp

PRESENTING CLINICAL SIGNS

Front right shoulder very painful starting yesterday, non weight bearing.

SPECIES

Dog

RADIOGRAPHIC STUDY OF THE RIGHT FRONT LIMB

3 mediolateral views of the right front limb and 1 craniocaudal view comparing both front limbs totaling 4 images available for review in jpeg format.

BREED

Australian Cattle Dog

Only jpg images were submitted. The transformation from DICOM to jpg only allows for limited manipulation of the image. For the best possible results, we suggest submitting DICOM images in the future. Please do not hesitate to contact us should you need any help with the submission process.

SEX

Male

RADIOGRAPHIC FINDINGS

There appears to be moderate generalized soft tissue swelling circumferential to the bones and joints of the right front limb. The changes appear to be accentuated in the region of the right elbow.

AGE

9 Weeks, 5 Days

No evidence of traumatic osseous or articular injury is seen.

Growth plate closure appears to be adequate for the patient age and symmetric between the right and left hind limb. The ossification centers are seen as expected.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Generalized soft tissue swelling of the right front limb.

HOSPITAL NAME

Countryside Animal
Clinic

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Nonspecific soft tissue swelling in the right front limb is noted. No concurrent osseous or articular injury can be identified. Consider septic cellulitis and trauma with soft tissue injury primary differential diagnoses. Joint fluid could be aspirated in order to rule out early septic arthritis.
