

**PATIENT**

Aslan Knight

PRESENTING CLINICAL SIGNS

on December Was sneezing , runny eyes & Nose recently , Crackles & Wheezes was heard during chest auscultation on PE August 7 , 2021 on auscultation wheezes heard , labored breath . less drinking water ,stool production is once per day and dehydrated

SPECIES

Feline

RADIOGRAPHIC STUDY OF THE THORAX

Lateral and orthogonal whole body views and views of the head and neck totaling 10 images available for review in jpeg format.

BREED

Domestic Shorthair

Only jpg images were submitted. The transformation from DICOM to jpg only allows for limited manipulation of the image. For the best possible results, we suggest submitting DICOM images in the future. Please do not hesitate to contact us should you need any help with the submission process.

SEX

Female Spayed

Thoracic read only upon client's request.

AGE

12 Years

The patient is obese.

There are caudal thoracic spondyloses at T11/12 and T12/13.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The abundance of subcutaneous mediastinal and pericardial fat contributes to the pulmonary opacity and presentation of the cardiac silhouette.

The radiographic presentation of the cardiac silhouette is within normal limits for the age and weight of the patient. There is no evidence of pulmonary vascular dilation.

HOSPITAL NAME

Wilson Road Vet
Clinic

No radiographic evidence of mediastinal lymphadenomegaly or mediastinal mass effect is noted.

Mild esophageal aerophagia is seen as well as mild gastric aerophagia.

Course and width of the trachea are considered within normal limits.

REFERRING VET

Dr, Nancy Abdelmalak

There is a mild bronchial lung pattern with diffuse distribution throughout the entire lung. Mild peribronchial cuffing is noted. No true increase in interstitial opacity is seen.

RADIOGRAPHIC DIAGNOSIS

- Mild active lower airway pattern.
- No radiographic evidence of cardiovascular pathology.
- No radiographic evidence of mediastinal enlargement.

46896

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**DATE**

8-7-21

The radiographic findings are suggestive for active lower airway disease with the two main differential diagnoses being allergic lower airway syndrome versus infectious bronchitis such as viral, bacterial, parasitic, or protozoal. The concurrent presence of upper airway pathology appears to be a potential based on the clinical history of the patient.
