

PATIENT

Gus Simpson

PRESENTING CLINICAL SIGNS

presented for TPLO - harsh right sided lung sounds - chest X-ray taken CT performed then FNA guided aspirates of mass collected - results pending
Abnormal PE/Chem/CBC/UA Results: abc/chem within normal limits

SPECIES

Canine

COMPUTED TOMOGRAPHIC STUDY OF THE THORAX

Plain and post contrast studies in soft tissue, bone, and lung windows available for review.

BREED

Spitz

COMPUTED TOMOGRAPHIC FINDINGS

The patient is obese.

SEX

MN

A 2 x 1 x 0.8 cm sized soft tissue attenuating ovoid structure is seen in the ventrocaudal peripheral aspect of the right cranial lung lobe. The remainder of the lung presents within age related normal limits.

No mediastinal lymphadenomegaly is seen.

AGE

11

The cardiovascular structures present within the expected limits.

The thoracic boundaries are considered within age related normal limits.

COMPUTED TOMOGRAPHIC DIAGNOSIS

- Single ovoid soft tissue nodule within the interstitium of the right cranial lung lobe.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Secondary neoplasia of the lung such as metastatic disease of an undetermined primary tumor, sarcoma, and early primary neoplasia of the lung are primary differential diagnoses. However, prior pneumonia scarring, pneumonic changes, fibrotic nodule, and granuloma cannot be ruled out as potential differential diagnoses. Correlate with the results of the sampling.
