

**PATIENT**

Daisy Wilson-Pote

PRESENTING CLINICAL SIGNS

few weeks of hematuria
Abnormal PE/Chem/CBC/UA Results: unremarkable

SPECIES

Feline

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views of the thorax and abdomen totaling 3 images available for review.

BREED

DSH

Abdominal read requested.

SEX

Female Spayed

RADIOGRAPHIC FINDINGS

The patient is obese.

The urinary bladder is mildly distended. No abnormal opacities are seen within the urinary bladder.

The descending colon contains a moderate amount of fecal matter. No evidence of deviation or displacement is seen.

AGE

13 Years

An ovoid mineral opaque structure is seen dorsal to the descending colon level with the 5th lumbar vertebra and measures 2mm in diameter. The same mineral opacity cannot be identified in the left lateral and orthogonal views.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

There is no evidence of sublumbar lymphadenomegaly.

The kidneys present within normal limits.

HOSPITAL NAME

St. Catherine's Animal
Hospital

Gastric aerophagia is noted.

Note the presence of an asymmetric lumbosacral transitional vertebra.

REFERRING VET

Dr. Boctor

RADIOGRAPHIC DIAGNOSIS

- No evidence of lower urinary tract obstruction.
- Mineral opacity caudal to the descending colon.
- Aerophagia.

INVOICE

53401

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The mineral opacity in the caudodorsal abdomen may represent ureterolith, bates body, or summation artifact since it is not repeated in the other views.

DATE

8-9-22

There is no evidence of lower urinary tract obstruction. Full urinalysis should be performed if not do so already. Further definition by means of abdominal ultrasound is recommended as well in order to rule out lower urinary tract infection, urinary tract neoplasia, and ureteral dilation/obstruction.
