

PATIENT

Bailey Emeric

PRESENTING CLINICAL SIGNS

Pet started vomiting about a month ago, vomited multiple times in the beginning. Since then she has had loss of appetite and started with diarrhea recently. Stool is soft if fed cooked rice, otherwise it is runny. Pet does chew on toys, not sure if swallowed any. Pet used to eat two bowls of food before, but now only eats one bowl of food. Energy is normal. not drinking water. no c/s
 Abnormal PE/Chem/CBC/UA Results: Diarrhea, Vomiting (subsided), Inappetence. R/O: Dietary indiscretion (FB ingestion) vs Parasites vs Gastroenteritis vs Other.

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

BREED

Pitbull

Right/left lateral and ventrodorsal views totaling 5 images available for review.

RADIOGRAPHIC FINDINGS

SEX

Female

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

AGE

2 Years

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

INTERPRETED BY

Nele Eley, DVM
 Dr. med. Vet. DipECVDI

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

HOSPITAL NAME

Animal Paradise
 Hospital

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

REFERRING VET

Dr. Kacham

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Radiographically normal abdomen.

INVOICE

47375

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The gastrointestinal tract presents within normal radiographic limits. There is no evidence of mechanical or paralytic ileus at the time of the radiographs. Consider dietary indiscretion, allergies, gastroenteritis, or other. Abdominal ultrasound could be considered in the further workup in order to gain more detailed information about the gastrointestinal tract's wall, content, and motility as well as the associated organs, if not performed already.
