Ranger Anderson-
Jangard

PRESENTING CLINICAL SIGNS

Fell off bed last night

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE STIFLES

Craniocaudal and mediolateral views of both stifles totaling 3 images available for review.

BREED

Pomeranian

RADIOGRAPHIC FINDINGS

Proximal displacement and cranial rotation of the tibial tuberosity is seen and accompanied by moderate regional soft tissue swelling as well as thickening of the patellar ligament accentuating its distal aspect.

SEX

Male

The left stifle presents within normal limits.

RADIOGRAPHIC DIAGNOSIS

- Salter Harris type 1 or 2 apophyseal fracture of the right tibial tuberosity with moderate to severe displacement and desmitis of the patellar ligament.

AGE

4 Months, 2 Weeks

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic findings suggest Salter Harris type 1 or 2 apophyseal fracture of the right tibial tuberosity. The fragment is proximally displaced and rotated. Mild proximalization of the patellar is seen as well; however, part of this may be positional. Consider open reduction and internal fixation.
