

PATIENT

Oliver Stansfield-Graves

PRESENTING CLINICAL SIGNS

Came in with lethargy, not eating, no bowel movement or urination since yesterday. Vomiting. Collected urine with catheter
 Abnormal PE/Chem/CBC/UA Results: Bloodwork revealed dehydration. Owner claims Oliver is FIV positive however has provided no records to confirm this

SPECIES

Feline

RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

Right/left lateral and ventrodorsal whole body views totaling 3 images available for review.

BREED

DSH

RADIOGRAPHIC FINDINGS

Thorax

There is mild generalized cardiomegaly with a vertebral heart score of 8.8. No overt atrial enlargement is seen on the orthogonal view. There is no evidence of cardiogenic pulmonary edema.

SEX

Male Neuter

The findings of the lung and bronchial tree are considered within normal limits.

AGE

20 Months

No evidence of mediastinal widening is seen.

Abdomen

The surrounding bony structures are within normal limits.

INTERPRETED BY

Nele Eley, DVM
 Dr. med. Vet. DipECVDI

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

HOSPITAL NAME

St. Catharine's Animal Hospital

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic tail is not seen.

Both kidneys are seen and present with normal size, shape, delineation and opacity.

REFERRING VET

Dr. Masoud

The urinary bladder is severely distended. No abnormal opacities are seen within the distended urinary bladder.

INVOICE

47447

The stomach is distended with a mild amount of food, fluid, and gas. No evidence of abnormal positioning or abnormal content is noted.

The small intestinal loops are evenly distributed throughout the mid abdomen without evidence of dilation plication or radiopaque foreign material.

DATE

9-16-21

A moderate amount of inspissated fecal material is present within the colon.

PATIENT

Oliver Stansfield-Graves

RADIOGRAPHIC DIAGNOSIS

- Distended urinary bladder.
- Delayed gastric emptying versus prior intake of fluid and food.
- Mild generalized cardiomegaly.

SPECIES

Feline

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The urinary bladder is severely distended on the abdominal radiographs which may be due to the patient withholding urine, polyuria, as well as feline lower urinary tract disease of various origin. No evidence of radiopaque calculi is seen. Consider further definition by means of ultrasound and urinalysis if not performed already.

BREED

DSH

There was no evidence of small intestinal ileus. Delayed gastric emptying may be a potential; however, the findings may still be within normal limits should the patient have had access to food and fluid close to the radiographic study.

SEX

Male Neuter

The impression of mild cardiomegaly may be due to diastolic exposure, anemia, bradycardia, or fever. Cardiomyopathy cannot be ruled out entirely. Correlate with the clinical workup. At this point, there is no evidence of cardiogenic pulmonary edema.
