

PATIENT PRESENTING CLINICAL SIGNS

Riley Marias patient having trouble with hips, the stifles were previously read, but would like to have hips evaluated
 Abnormal PE/Chem/CBC/UA Results: PE--tense lower lumbar and upper thoracic vertebra

SPECIES RADIOGRAPHIC STUDY OF THE PELVIS

Canine Ventrodorsal hip extended view of the pelvis available for review.

BREED RADIOGRAPHIC FINDINGS

Maltipoo The radiographic presentation of the coxofemoral joints is within age and breed related normal limits. The femoral heads are deeply situated within their acetabular grooves and well covered by the dorsal acetabular rim. The joint spaces are congruent. No evidence of osteophytes is present in the femoral heads and necks nor in the acetabular rim.

SEX

MN The muscle volume of both hind limbs is adequate and symmetric.

AGE

7 The radiographic presentation of the stifles is within normal limits except for presence of cartilage remnants in the tibial tuberosities.

RADIOGRAPHIC DIAGNOSIS

- Normal age related pelvis.

INTERPRETED BY

Nele Eley, DVM
 Dr. med. Vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic presentation of the coxofemoral joints is within normal limits. There is no evidence of pelvic bone pathology, canine hip dysplasia, osteoarthritic changes, traumatic osseous injury, or aggressive bone lesions.
