

PATIENT

Amber Chung

PRESENTING CLINICAL SIGNS

Multiple occurrences of diarrhea

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

Right lateral and ventrodorsal whole body views totaling 2 images with the cranial lung lobes not being fully included available for review.

BREED

Poodle Mix

RADIOGRAPHIC FINDINGS

Thorax

The surrounding bony structures are within normal limits.

The extrathoracic soft tissues present homogeneous without abnormalities.

SEX

FS

The heart is of normal size and shape and there is no evidence of cardiac chamber or vascular enlargement. The pulmonary vasculature is within normal limits.

AGE

6 Months

The cranial mediastinum presents the expected soft tissue opacity. The mediastinal width is less than twice the width of the vertebral column at the same level.

The trachea is normal in diameter and presents the anticipated course. The luminal outline of the trachea is smooth.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

The bronchial tree presents with thin walls and tapers uniformly towards the periphery as expected.

The lung parenchyma presents the expected architecture and opacity. The intrapulmonary vascular branching is seen up to the third order lung vessels.

HOSPITAL NAME

Animal Paradise
Hospital

The diaphragm is well delineated with even surface and the expected mild cranial bulging of the diaphragmatic cupola.

Abdomen

REFERRING VET

Dr. Mostafa Elshafie

The surrounding bony structures are within normal limits.

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

INVOICE

47481

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

The liver is appropriate in position, size and presents uniform opacity.

DATE

9-20-21

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and

**PATIENT**

lower urinary tract.

Amber Chung

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are mildly turgid in appearance.

SPECIES

The colon is seen in the expected position and presents with appropriate content.

Canine

RADIOGRAPHIC DIAGNOSIS**BREED**

- Radiographically normal thorax and abdomen.

Poodle Mix

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no evidence of gastrointestinal ileus and no other structural pathology of the gastrointestinal tract that could explain the patient's clinical signs. Depending on the severity and duration of the clinical signs, further definition by means of ultrasound could be considered in order to gain more detailed information about the gastrointestinal tract's wall, content, motility, and associated organs.
