RADIOGRAPHIC STUDY OF THE ABDOMEN

Lateral and orthogonal views totaling 5 images available for review. One of the lateral views has detector oversaturation. The remainder of the views are diagnostic with good radiographic quality.

BREED

Golden

RADIOGRAPHIC FINDINGS

The surrounding bony structures are within normal limits.

SEX

MN

No abnormalities of the extraabdominal soft tissues are noted. The abdominal wall is smooth and thin.

The serosal detail is maintained throughout the peritoneal and retroperitoneal space.

AGE

10

The liver is appropriate in position, size and presents uniform opacity.

The splenic head is in the anticipated position and within normal limits for size and opacity. The splenic body and tail are considered normal for position, size, shape and opacity.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

Both kidneys are seen and present with normal size, shape, delineation and opacity. The urinary bladder is in its anticipated position. No radiopaque calculi are noted throughout the upper and lower urinary tract.

HOSPITAL NAME

Torch Lake
Veterinary Clinic

The stomach is in its anticipated position and presents normal content.

The small intestinal loops are of even diameter and non-dilated, a small amount of gas is seen within the small intestinal loops and considered within normal limits.

The colon is seen in the expected position and presents with appropriate content.

RADIOGRAPHIC DIAGNOSIS

- Radiographically normal abdomen.
- No evidence of mechanical ileus or radiopaque foreign material.

INVOICE

47438

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no signs of mechanical ileus. There is no evidence of small intestinal dilation, and no radiopaque foreign material is noted. There also is no evidence of the typical radiographic presentation of fabric throughout the gastrointestinal tract as visible. Correlate with the corresponding ultrasonographic study to further rule out signs of subileus or paralytic ileus in this patient.
