

**DATE PRESENTING CLINICAL SIGNS**

9-20-21 History of LF leg lameness. Non responsive to gabapentin and deramaxx. 2 month history of coughing.

PATIENT

Spock Juliana

RADIOGRAPHIC STUDY OF THE SHOULDERS

Mediolateral and caudocranial views of both shoulders totaling 3 images available for review.

RADIOGRAPHIC FINDINGS**SPECIES**

Canine

The radiographic presentation of both shoulders is within age related normal limits. No evidence of osteoarthritic, osteochondritis, or aggressive bone lesions is seen.

BREED

Border Collie Mix

The intervertebral disc space width is reduced at C5/6 with vertebral end plate remodeling and new bone formation bridging the intervertebral disc space ventrally.

Mild spondyloses are present at C6/7 and C2/3.

The elbows present within normal limits.

SEX

Female Spayed

RADIOGRAPHIC DIAGNOSIS

- Radiographically normal shoulders.
- Radiographic evidence of chronic intervertebral disc disease within the cervical spine accentuating C5/6.

AGE

7/26/09

INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study reveals no evidence of osseous pathology in the shoulders. Soft tissue injury cannot be ruled out and one potential next to biceps and supraspinatus tendinopathies would also be chronic degenerative medial instability syndrome with the pertinent patient demographics. However, cervical spinal disease should be considered and ruled out as well owing to the presence of degenerative changes which typically are associated with intervertebral disc disease within the cervical spine accentuating C5/6.
