

**PATIENT**

Finley Plants

PRESENTING CLINICAL SIGNS

Chronic lameness after jumping off couch in Feb 2021. Painful on flexion of elbows with supination of carpus. Pain worsens with medical pressure.
Abnormal PE/Chem/CBC/UA Results: N/A

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ELBOWS & PELVIS

Mediolateral, neutral, and flexed views of the elbows, craniocaudal views of both elbows, and lateral and ventrodorsal hip extended views of the pelvis totaling 7 images available for review.

BREED

Golden Retriever

RADIOGRAPHIC FINDINGS**Elbows**

The medial coronoid process is well delineated and uniformly opacified in both elbows. The joint spaces are congruent. There is no evidence of subchondral bone lesions and no evidence of osteoarthritis.

SEX

M

Pelvis

The conformation of the coxofemoral joints is considered within normal limits. Both femoral heads are adequately covered. The joint spaces are congruent and narrow. There is no evidence of incongruity, laxity, or osteoarthritis in either of the coxofemoral joints.

AGE

1 Year

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

RADIOGRAPHIC DIAGNOSIS

- Radiographically normal elbow and hip joints without evidence of elbow or hip dysplasia.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study is negative for elbow dysplasia. Very few cases of elbow dysplasia are radiographically occult. The potential for medial coronoid pathology is considered very low based on the radiographic findings and lameness of other origin should be considered. Should a strong suspicion for medial coronoid pathology or other type of elbow dysplasia remain despite the negative radiographic findings, CT would be an appropriate technique for further definition.
