PRESENTING CLINICAL SIGNS

Chief Complaint: painful RH leg History: Sam, 3y 2m old MN Goldendoodle, presents for painful rh leg. Whining last night. No known injury. Also mentions pet itchy on rear end, hx FAD, Abnormal PE/Chem/CBC/UA Results: CV/Respiratory: Normal heart rate and rhythm, no murmur, pulses strong and synchronous, normal bronchovesicular sounds. EENT: Clear OU and AU. No nasal discharge. No cough on tracheal palpation. Oral cavity: N Musculoskeletal: BCS = 5/9. Ambulatory x 4. RH: intermittent grade 1/5 lameness, "click" on manipulation of coxofemoral joint. Uro/Perineum: Intact male, 2 descended testicles Abd/GI: Soft, non-painful. No masses or fluid wave palpated Lymph Nodes: No peripheral lymphadenopathy Neurological: Alert and appropriate. No significant abnormalities Skin: Good hair coat. No ectoparasites seen Mentation: BAR Hydration: N

RADIOGRAPHIC STUDY OF THE PELVIS**SEX**

Male

Ventrodorsal hip extended view of the pelvis and lateral view of the pelvis totaling 2 images available for review.

AGE

3 Years, 2 Months

RADIOGRAPHIC FINDINGS

Femoral head coverage is more than 50% in both coxofemoral joints. The joint spaces are largely congruent. A mild amount of circumferential femoral head and caudolateral curvilinear femoral neck osteophytes is seen bilaterally.

The muscle volume of the left hind limb appears to be reduced.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

Lateral luxation of the left patella is seen and appears to be stationary between the ventrodorsal and lateral images.

RADIOGRAPHIC DIAGNOSIS**HOSPITAL NAME**

DPC Veterinary
Hospital

- Minimal bilateral coxofemoral osteoarthritis.
- Lateral patella luxation of the left stifle.
- Disuse atrophy of the left hind limb musculature.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**REFERRING VET**

Dr. Rivera

Subtle osteoarthritic changes of both coxofemoral joints are seen radiographically. No true dysplastic conformation of the hip joints is evident. The findings are of questionable clinical significance.

INVOICE

47577

There appears to be mild chronic disuse of the left hind limb as indicated per the muscle atrophy which may well be due to the lateral patella luxation seen on both the ventrodorsal and lateral images.
