

**PATIENT**

Santana Gillen

PRESENTING CLINICAL SIGNS

Presented to us limping. O is not sure, she says limps occasionally in R hind leg, however, on the L hind the drawer test is positive. The R-hind leg has possibility of having a partial tear. Need to rule out ACL vs. plasias vs. arthritis vs. others.

SPECIES

Canine

Abnormal PE/Chem/CBC/UA Results: NA

BREED

Australian Shepherd

RADIOGRAPHIC STUDY OF THE STIFLES & PELVIS

Mediolateral views of both stifles, ventrodorsal hip extended and lateral views of the pelvis, and lateral and ventrodorsal views of the tail totaling 11 images available for review.

Pelvic and stifle read requested.

RADIOGRAPHIC FINDINGS**SEX**

Spayed Female

Moderate articular swelling of the right stifle joint is seen. There appears to be mild cranial thrust of the tibia and mild periarticular osteophytosis in the right stifle joint.

The left stifle joint presents within normal limits.

AGE

12 Years

There is moderate disuse atrophy of the right hind limb musculature.

The right coxofemoral joint presents within normal limits. The left coxofemoral joint presents evidence of mild dysplasia and coxofemoral osteoarthritis.

INTERPRETED BYNele Eley, DVM
Dr. med. Vet. DipECVDI**RADIOGRAPHIC DIAGNOSIS**

- Moderate right stifle osteoarthritis with radiographic evidence of cranial cruciate ligament injury.
- Disuse atrophy of the right hind limb musculature.
- Mild left coxofemoral joint dysplasia with moderate osteoarthritis.
- Radiographically normal left stifle.

HOSPITAL NAMETruscott Animal
Hospital**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS****REFERRING VET**

Medhat Meawad

The radiographic findings are suggestive for osteoarthritis and cranial cruciate ligament injury in the right stifle with chronic disuse of the right hind limb. Moderate left coxofemoral osteoarthritis secondary to hip dysplasia is seen as well. The left stifle joint presents within normal limits.
