

PATIENT

Rocky Mulaj

PRESENTING CLINICAL SIGNS

suspected mass in abdomen AUS report is also attached

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE THORAX & ABDOMEN

Right/left lateral and ventrodorsal views totaling 6 images available for review.

BREED

Shih Tzu

RADIOGRAPHIC FINDINGS

Abdomen

The abdominal cavity is voluminous.

Segmental enlargement of the liver appears to be present with rounded lobar margins on the left side.

SEX

Neutered Male

The stomach is postprandial.

The small intestinal loops are evenly distributed throughout the mid abdomen and of even diameter but mildly turgid in appearance.

AGE

11 Years

Thorax

There are severe osteoarthritic changes of the elbows.

The lungs are fairly inflated. A mild generalized bronchial lung pattern and occasional age related incidental pulmonary osteomas are seen.

Course and width of the trachea are considered within normal limits.

There is no radiographic evidence of cardiovascular pathology. The pulmonary vasculature and caudal vena cava are thin.

No evidence of interstitial nodules or masses and no evidence of mediastinal lymphadenomegaly is seen.

INTERPRETED BY

RADIOGRAPHIC DIAGNOSIS

- Suspect mass like enlargement of the liver.
- Small intestinal maldigestion pattern.
- Normal age related thorax.
- Elbow osteoarthritis

INVOICE

54354

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study suggests mass-like enlargement of the left division of the liver. Neoplasia, benign nodular hyperplasia, abscess, hematoma, and granuloma are potential differential diagnoses to correlate with the available ultrasonographic findings. Sampling could be considered for further definition and discussed versus CT to plan potential surgery.
