

**PATIENT PRESENTING CLINICAL SIGNS**

Dudley Borchartd Large mass on caudomedial aspect of left antebrachium, cytology consistent with MCT.

**SPECIES COMPUTED TOMOGRAPHIC STUDY OF THE FOREARMS**

Canine Plain and post contrast studies available for review.

**BREED COMPUTED TOMOGRAPHIC FINDINGS**

Goldendoodle An approximately 12 x 3.5 x 5cm sized large spindle shaped soft tissue attenuating mass is seen medial and caudal to the left forearm. The thickest part of the mass is seen medial and distal to the left elbow. Lesion margins are ill-defined. Attenuation and enhancement pattern are uniform. However, the lesion tissue cannot be clearly delineated from the underlying tissues. No evidence of aggressive osteolytic changes of the elbow is seen.

**SEX** Both elbow joints present minimal osteoarthritic changes unrelated to the presence of a mass. No evidence of elbow dysplasia is seen.

Neutered Male

**COMPUTED TOMOGRAPHIC DIAGNOSIS**

- AGE**
- Large spindle shaped soft tissue mass caudomedial to the left forearm compatible with the history of mast cell tumor.
- 15 Years

**INTERPRETATION OF FINDINGS & FURTHER RECOMMENDATIONS**

**INTERPRETED BY** The CT study reveals a large ill-defined soft tissue mass medial and caudal to the left forearm. Lesion margins are ill-defined. The mass is directly adjacent to the elbow and radius however no evidence of aggressive osteolytic changes is seen at this point. Complete staging is recommended to plan further treatment accordingly.
