

PATIENT

Oreo Valentin

PRESENTING CLINICAL SIGNS

Previous radiographs showed possible radiolucent foreign object. Please compare to previous radiographs.

SPECIES

Canine

RADIOGRAPHIC STUDY OF THE ABDOMEN

Right/left lateral and ventrodorsal views of the abdomen totaling 3 images available for review and compared to prior study dated 9-2.

BREED

Maltese Mix

RADIOGRAPHIC FINDINGS

The segmental dilation with gas within the small intestine has resolved compared with the prior study. The small intestinal loops are evenly distributed throughout the mid abdomen. They are rigid and turgid in appearance with the subjective impression of mild generalized wall thickening throughout the small intestine. However, diagnostic accuracy of radiographs is very limited in this regard.

SEX

Neutered Male

The stomach, cecum, and parts of the colon contain a mild amount of gas. They are seen within their anticipated positions with no evidence of abnormal content, dilation, or displacement.

AGE

3 Years, 9 Months

The abdominal serosal detail is maintained.

RADIOGRAPHIC DIAGNOSIS

- No radiographic evidence of mechanical ileus or radiopaque/radiolucent foreign material.

INTERPRETED BY

Nele Eley, DVM
Dr. med. Vet. DipECVDI

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The radiographic study is negative for mechanical ileus. Functional ileus remains a potential and the subjective impression of generalized small intestinal wall thickening should be noted. Diagnostic accuracy of radiographs has obvious limitations in this regard. However, abdominal ultrasound should be considered for further definition in case of persisting or deteriorating clinical signs.
