PRESENTING CLINICAL SIGNS

History: Presented last week for ear/skin infection Abdominal mass was incidentally palpated Patient lost 10lbs but hadn't been eating well and now eating well off apoquel. Hx of loose stools on apoquel but as been on it hos whole life.
Abnormal PE/Chem/CBC/UA Results: n/a

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is small with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 5.8 cm, right measured 6.5 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident.

The prostate is small and hypoechogenic.

Adrenal Glands

The left adrenal gland is normal in shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.58 cm in width. The right adrenal gland was not clearly visualized, but appears to be of normal shape, echogenic appearance and size.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 1.6 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The pancreas is not visualized.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

A large, irregular, mottled echogenic abdominal mass measuring at least 7.0 x 8.0 cm in size. This is not associated with any obvious organ system. Possibilities being the spleen and mesentery.

ULTRASONOGRAPHIC FINDINGS

- Abdominal mass.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most likely etiology for the abdominal mass would be neoplasia with granuloma a less likely differential diagnosis.

Further assessment would be three view thoracic radiographs, echocardiography to evaluate the right atrium and right auricle and possibly FNA cytology of the mass.

Laparotomy should be considered as it could be both diagnostic and therapeutic with further specific therapy dependent on an etiological diagnosis.
