PRESENTING CLINICAL SIGNS

- Ongoing GI issues, mainly diarrhea. Bloodwork and fecal molecular testing was all normal. History of enlarged SM lymph nodes, aspirated 9/25 which revealed suspicious but not definitive for lymphoma. Dental disease present, but owners have not pursued that yet, as they wanted to address these new GI findings. Lymph nodes peripherally all normal today.
- Weight loss 2# over past few months.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is small with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Enlarged iliac lymph nodes measuring up to 0.8 x 2.0 cm in size with a hypoechoic appearance and a rounded shape. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 4.0 cm, right measured 4.5 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is evident in both kidneys.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.47 cm in width. The right adrenal gland measured 0.49 cm and 0.43 cm in width.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 1.0 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

The gallbladder is full containing a scant amount of floating, hyperechogenic sediment. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Enlarged mesenteric, hepatic and gastric lymph nodes measuring up to 1.2 x 2.5 cm in size with a hypoechoic appearance and a rounded shape.

Hyperechogenic appearance of the mesentery surrounding the lymph nodes.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Abdominal lymphadenomegaly.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most likely etiology for the abdominal lymphadenomegaly would be lymphoma with granulomatous disease a less likely differential diagnosis.

Further assessment would be FNA cytology of the lymph nodes.

Specific therapy would be dependent on an etiological diagnosis.
