PRESENTING CLINICAL SIGNS

History: Anemia of unknown cause No clinical signs FIV positive 2lb wt loss in 1 yr Has a heart murmur (3/6)

Abnormal PE/Chem/CBC/UA Results: HCT 21.7%, Hb 4.9, RBC 3.81, Glu 232, neg urine 3+ bld and 1pro but was a cysto

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 4.4 cm, right measured 4.0 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is evident in both kidneys.

Adrenal Glands

The adrenal glands were not clearly visualized, but appears to be of normal shape, echogenic appearance and size.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 0.9 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Enlarged mesenteric lymph nodes measuring up to 0.8 x 1.6 cm in size. Some of the lymph nodes had a rounded shape and a hypoechogenic appearance.

No ascites evident.

Large, irregular, hypoechogenic mass like structure in the cranial midabdomen measuring 1.5 x 3.8 cm in size with a hyperechogenic appearance of the surrounding mesentery. The mass most likely originates from a mesenteric lymph node.

ULTRASONOGRAPHIC FINDINGS

- Abdominal mass.
- Mesenteric lymphadenomegaly.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most likely etiology for the mass and the mesenteric lymphadenomegaly would be neoplasia such as lymphoma with granulomatous disease a less likely differential diagnosis.

Further assessment would be FNA cytology of the mass as well as of the mesenteric lymph nodes.

Specific therapy would be dependent on an etiological diagnosis.
