PRESENTING CLINICAL SIGNS

History: Pt presented for blood in urine and weight loss. Pt lost 1.5 pounds in 3 months. Pt is also PU/PD over several weeks as per O. CBC/Chem/T4 WNL with the exception of elevated WBC and slightly decreased HCT. Urine dipstix indicated blood and Leukocytes +++. Radiographs showed a mass like structure in the mid abdomen.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 3.6 cm, right measured 3.7 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is evident in both kidneys.

Adrenal Glands

The left adrenal gland is normal in shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.9 cm in length x 0.38 cm in width. The right adrenal gland was not clearly visualized, but appears to be of normal shape, echogenic appearance and size.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 0.4 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

Irregular, hypoechogenic mass in the midabdomen measuring 3.0 x 3.6 cm in size. This is not associated with any obvious organ.

Hyperechogenic of the mesentery surrounding the mass.

ULTRASONOGRAPHIC FINDINGS

- Abdominal mass.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Etiologies for the abdominal mass would be neoplasia, granuloma or organized abscess and possible organized hematoma.

Possible organs of origin of the mass would be the mesentery and the mesenteric lymph node.

Further assessment would be FNA cytology of the mass, tru cut or wedge biopsy of the mass may be required for a final etiological diagnosis.

Specific therapy would be dependent on an etiological diagnosis.
