PRESENTING CLINICAL SIGNS

Failure to thrive. Intermittent but increase in tachycardia, systolic hm 2-3/6, neuro signs/ataxia/incontinence/losing weight Current Medications lactulose 0.5ml TID

Abnormal PE/Chem/CBC/UA Results: FELv/FIV/corona NEG on PCR, Pro BNP normal. Normal pre/post bile acids, m1 monocytosis, m1 decrease MCV, mild decrease Creat Urine: Normal clear, yellow. B1 + , PH 6.0, prot +, odd RBC , epithelial cell , odd hyaline cast, SG- >1.050 See attached ECG and bloodwork

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

Full urinary bladder with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size, architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Left kidney measured 3.2 cm. Right kidney measured 3.5 cm. Normal color flow pattern evident in both kidneys.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left measured 0.52 cm in length x 0.37 cm in width. Right measured 0.48 cm in length x 0.34 cm in width.

Spleen

Normal size (0.70 cm in width) and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

Small containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

Visible sections present normal size and echogenic appearance. Regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Prominent mesenteric lymph nodes measuring up to 0.40 cm x 0.90 cm in size, maintaining normal shape and echogenic appearance.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Mesenteric lymphadenomegaly.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most likely etiology for the mesenteric lymphadenomegaly would be reactive hyperplasia, with lymphadenitis and infiltrative neoplasia being highly unlikely differential diagnoses. With the presenting clinical signs, primary neurologic disease such as FIP and congenital anomalies need to be considered.

Further assessment would include FNA cytology of the mesenteric lymph nodes, and possibly MRI scan and CSF analysis.

Specific therapy would be dependent on an etiological diagnosis.
