PRESENTING CLINICAL SIGNS

History: Not eating for 4 days, weight loss, lethargic
Mid abdominal mass palpated on exam, Blood WBC 57.9, NEUTROPHILS 46,899, ALB 2.0TP 5.7,
TOTAL BILI 0.6,

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is small with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 3.9 cm, right measured 4.3 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.33 cm in width. The right adrenal gland measured 1.2 cm in length and 0.27 cm in width.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 0.9 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is small containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

A large, irregular, mottled echogenic, poorly vascularized cystic mass in the mid cranial abdomen not associated with any obvious organ. The mass measures at least 3 x 6 cm in size.

ULTRASONOGRAPHIC FINDINGS

- Abdominal mass.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

With the elevated white cell count an important etiology for the mass would be abscessation with neoplasia and granulomatous disease a differential diagnosis.

Further assessment would be three view thoracic radiographs and FNA cytology of the mass for cytology and culture.

Laparotomy should be considered as it can both be diagnostic and therapeutic with further specific therapy dependent on an etiological diagnosis.
