PRESENTING CLINICAL SIGNS

History: Recent onset of PU/PD and proteinuria.

Abnormal PE/Chem/CBC/UA Results: CBC - WNL Chem - mildly elevated AlkPhos 365 (n 23-212), ALT 244 (n 10-125) UA - 3+ protein, USG 1.020 Lepto SNAP - negative

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 5.2 cm, right measured 5.5 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident.

Adrenal Glands

The left adrenal gland is normal in shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.65 cm in width. The right adrenal gland was not visualized.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 2.8 cm in width.

Liver

Large, irregular, poorly defined, mottled echogenic mass in the right lobe measuring 5.0 x 6.0 cm in size. The rest of the liver is of normal size, maintaining a normal echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or additional masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing a small amount of non-adhered, hyperechogenic sediment. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen. A moderate amount of ingesta was present in the stomach compatible with a recent meal.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Hepatic mass.
- Gallbladder sediment.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most likely etiology for the hepatic mass would be neoplasia with granuloma and organized hematoma a less likely differential diagnosis.

The gallbladder sediment is most likely an incidental finding.

Further assessment would be three view thoracic radiographs and FNA cytology of the mass. A tru cut or wedge biopsy of the mass may be required for a final etiological diagnosis.

If surgery is being contemplated for the hepatic mass then a CT scan would be recommended.
