PRESENTING CLINICAL SIGNS

History: Presented on Dec. 20th with elevated temp, anorexia, and cranial abdominal pain. Dehydrated. Fluid therapy in hospital to correct dehydration since Dec. 20th with ampicillin and buprenorphine for comfort

Abnormal PE/Chem/CBC/UA Results: BW abnormalities: Hct 68% Hgb High retics High alb 44 TBIL 46 urine: SG > 1.050 pr 30 hematuria --iatrogenic? bilirubinuria - 3mg/dL urobilinogen- 4mg/dL

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 4.0 cm, right measured 3.4 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.46 cm and 0.36 cm in width. The right adrenal gland measured 0.52 cm and 0.56 cm in width.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 1.1 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing a small amount of non-adhered, hyperechogenic sediment. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen. Duodenum measured 0.45 cm, small intestine measured up to 0.44 cm.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Gallbladder sediment.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

On this ultrasound there is no obvious etiology for the presenting clinical signs as the gallbladder sediment is most likely an incidental finding.

Although the visible sections of the pancreas appear ultrasonographically normal, underlying low-grade pancreatitis should be considered.

Further assessment would be CPL/PSL assay. Further specific therapy would be dependent on an etiological diagnosis.
