PRESENTING CLINICAL SIGNS

- Fractious cat that requires injectable sedation for exam
- Recently examined for new SQ mass (lipoma) and at time of exam o mentioned patient is PU/PD
- Bloodwork and UA pending, because patient requires sedation for all visits o requested abdominal ultrasound at time of sedation
- 10/2025 CBC CHEM T4 UA all Within Normal Limits - new results for these tests + FIV/FelV+ fructosamine, FGF 23 and Cystatin B pending

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 3.5 cm, right measured 3.8 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, and capsule. No infarcts, mineralization or renoliths evident. Mild, bilateral pyelectasia was visualized.

Adrenal Glands

The adrenal glands are not clearly visualized, but appear to be of normal shape, echogenic appearance and size.

Spleen

The spleen is mildly enlarged and measured 1.1 cm in width, but maintained a normal echogenic appearance, smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is small containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Splenomegaly.
- Pyelectasia.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most likely etiology for the splenomegaly would be reactive hyperplasia with splenitis and infiltrative neoplasia unlikely differential diagnosis.

Although the pyelectasia may be an incidental finding, underlying low-grade pyelonephritis needs to be considered especially with the presenting clinical signs.

Further assessment would be based on the pending results, but could include urine culture and FNA cytology of the spleen.

Specific therapy would be dependent on an etiological diagnosis.
