PRESENTING CLINICAL SIGNS

- Pt is presented for lethargy, muscle wasting, weight loss and being PU/PD. BW abnormalities are as follows: RBC 6.37 (6.54-12.2), SDMA 18 (0-14), BUN 47 (16-36), CREA 2.9 (0.8-2.4), PLI 26.7 (0.0-4.4)

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is small with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 3.1 cm, right measured 3.0 cm), increased echogenic appearance, loss of cortico-medullary differentiation, normal pelvis, and an irregular capsule. No infarcts, mineralization or renoliths evident. Poor color flow pattern is evident in both kidneys.

Adrenal Glands

The left adrenal gland was poorly visualized, but appears to be of normal shape, echogenic appearance and size. The right adrenal gland was not visualized.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 0.8 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is small containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen. Fecal material is present within the colon.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Renal disease.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The appearance of the kidneys is consistent with chronic kidney disease with possible etiologies being previous acute kidney injury, bacterial nephritis, hypertensive nephropathy, obstructive uropathy and a congenital anomaly.

Further assessment would be urinalysis, urine culture, UPC (if culture and sediment are negative) and blood pressure.

A renal biopsy would be required for a specific etiological diagnosis. However, this would be unlikely to change the management of the renal disease.

Management of the renal disease would be feeding a renal diet, use of enteric phosphate binders as needed and either an ace inhibitor or receptor blocker.
