PRESENTING CLINICAL SIGNS

History:

- Anorexia & lethargy. Enlarged sub mandibular lymph nodes. Evaluate for lymphoma. Labs attached

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

Full urinary bladder containing scant amount of floating hypoechogenic sediment. with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size, architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern evident in both kidneys. The left kidney measured 7.2 cm. The right kidney measured 7.6 cm.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. The left adrenal gland measured 3.53 cm length x 0.54 cm and 0.37 cm width. The right adrenal gland measured 3.53 cm length x 0.43 cm and 0.87 cm.

Spleen

The spleen was absent (previous splenectomy). Normal appearance of the anatomical area of the spleen.

Liver

Normal size with diffuse increased echogenic and coarse appearance. Normal portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

Full containing a small amount of non-adhered hypoechogenic sediment. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

The visible sections of the pancreas exhibited normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen. Small amount of ingesta present within the stomach compatible with a recent meal. Small intestine measured up to 0.42 cm.

Pancreas

Normal size and echogenic appearance. Regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Hepatopathy
- Gallbladder sediment

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Likely etiologies for the hepatopathy would be reactive hyperplasia, vacuolar and metabolic with hepatitis and infiltrative neoplasia highly unlikely differential diagnoses. The gallbladder sediment can be considered an incidental finding with the anemia evident on hematology and the low albumin; low-grade gastric ulceration needs to be considered.

Initial further assessment (if not already done) would be FNA cytology of the submandibular lymph nodes. Gastroscopy with biopsies should also be considered. Specific therapy will be dependent on an etiological diagnosis.
