## PRESENTING CLINICAL SIGNS

History: Weight loss and on rad has a large spleen

Abnormal PE/Chem/CBC/UA Results: Reticulocyte Hemoglobin 22.8 (23.8 - 28.3 pg MCH 22.0 (22.1 - 26.7 pg L MCHC 321.4 (323.0 - 380.0 g/L L Globulin 42 (24 - 40 g/L ALT 128 (18 - 121 U/L Triglyceride 2.15 (0.23 - 1.71 mmol/L H Lipase 509 (0 - 250 U/L H

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### *Urinary System*

The urinary bladder is small with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 4.6 cm, right measured 5.0 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is evident in both kidneys.

### *Adrenal Glands*

The left adrenal gland is normal in shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.6 cm and 0.58 cm in width. The right adrenal gland was not visualized, but appears to be of normal shape, echogenic appearance and size.

### *Spleen*

The spleen was large, irregular, mottled echogenic mass at the head of the spleen measuring 2.1 x 2.7 cm in size. The rest of the spleen is of normal size maintaining a normal echogenic appearance, smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. The spleen measures 2.1 cm in width.

### *Liver*

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

### *Gallbladder*

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

**PATIENT**

Willow Hendricks

**SPECIES**

Canine

**BREED**

Corgi

**SEX**

Spayed female

**AGE**

**Gastrointestinal**

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

**Pancreas**

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

**Free Abdomen**

Normal mesenteric lymph nodes.

No ascites evident.

**ULTRASONOGRAPHIC FINDINGS**

- Splenic mass.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The likely etiologies for the splenic mass would be hematoma, granuloma and emerging neoplasia such as hemangiosarcoma.

Further assessment would be three view thoracic radiographs, echocardiography to evaluate the right atrium and right auricle and possibly FNA cytology of the splenic mass.

Splenectomy should be considered as it could be both diagnostic and therapeutic with further specific therapy dependent on an etiological diagnosis.
