## PRESENTING CLINICAL SIGNS

Presented 4/6 for surgical excision of MCT and another benign mass. During prep, incidental finding of an abdominal mass. Doing well @ home.

Abnormal PE/Chem/CBC/UA Results: Abdominal mass PE WNL except masses Creatinine trending up (1.1 on 12/24 and 1.5 on 3/16)

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### Urinary System

Small urinary bladder containing a scant amount of floating hyperechogenic sediment, with a normal thickness and smooth appearance of the wall.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size, architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Left kidney measures 5.8 cm. Right kidney measures 6.4 cm.

### Reproductive System

Small, hypoechogenic prostate.

### Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left measures 2.77 cm in length x 0.53 cm and 0.40 cm in width. Right measures 2.9 cm in length x 0.45 cm and 0.45 cm in width.

### Spleen

Normal size (1.6 cm in width) and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident.

### Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

### Gallbladder

Small containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

### Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

## Pancreas

The pancreas is not clearly visualized, but visualized sections present normal size and echogenic appearance. Regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

## Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

A large, irregular, mottled echogenic and cystic mass is noted measuring approximately 5.8 cm x 6.7 cm in size in the caudal abdomen, not associated with any obvious organ.

## ULTRASONOGRAPHIC FINDINGS

- Abdominal mass.

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most likely etiology for the abdominal mass would be neoplasia, with granuloma and hematoma being less likely differential diagnoses. The most likely organ of origin would be the mesentery.

Further assessment would be 3-view thoracic radiographs and possibly FNA cytology of the mass.

If surgery is being contemplated for the mass, then a CT scan would be recommended.
