PRESENTING CLINICAL SIGNS

History: P presented 5/11/26 for distended abdomen, decreased appetite, and panting- several day duration of symptoms. BW showed NSF, p seems painful on abdominal palpation. Radiographs show kidney stones. P not improving today, O brought p back in for u/s. Was also rec'd to consider CT for this p to evaluate for kidney stones, but o declined and elects to start with u/s.

Abnormal PE/Chem/CBC/UA Results: 5/11/26 CBC- PLT 501 k/uL, Chem/lytes- Phos 2.4 mg/dL

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 3.2 cm, right measured 3.5 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts or mineralization evident. Small, non-obstructive, renolith present in the left kidney measuring 0.5 cm. Normal color flow pattern is evident in both kidneys.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.4 cm in width. The right adrenal gland measured 0.38 cm in width.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 1.5 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Renolith.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

In essence a normal ultrasound examination of the abdomen as the renolith can be considered an incidental finding (no obstruction evident or distension of the kidney).

On this ultrasound there is no obvious etiology for the presenting clinical signs.

With the presenting clinical signs, spinal disease should be considered.

Further assessment would be full neurological examination and survey radiographs of the thoracolumbar spine.

Specific therapy would be dependent on an etiological diagnosis.
