PRESENTING CLINICAL SIGNS

History: Chronic Diarrhea (2months+), decreased appetite, weight loss, hypoalbuminemia
Abnormal PE/Chem/CBC/UA Results: 4/21/26 - alb 2.4, Ca 8.6, T4 1.4, plt 424, UA 1.012, 6.5, 11-20
Ca Ox, negative protein.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 5.8 cm, right measured 6.2 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident.

Small hypoechoic prostate.

Adrenal Glands

The left adrenal gland is normal in shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.74 cm in width. The right adrenal gland was not clearly visualized, but appears to be of normal shape, echogenic appearance and size.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 1.6 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Enlarged mesenteric lymph nodes measuring up to 2.0 x 3.0 cm in size with a hyperechogenic appearance and a slightly rounded shape.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

Mesenteric lymphadenomegaly.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Etiologies for the mesenteric lymphadenomegaly would be reactive hyperplasia secondary to the chronic diarrhea with infiltrative neoplasia such as lymphoma a possible differential diagnosis and lymphadenitis an unlikely differential diagnosis.

Further assessment would be based on the pending results but could FNA cytology of the mesenteric lymph nodes and endoscopy of the upper GI tract with biopsies.

Specific therapy would be dependent on an etiological diagnosis.

Symptomatic management that could be considered would be feeding a novel protein/hypoallergenic diet, course of Fenbendazole (if indicated), cobalamin supplementation (if indicated) and if there is not a satisfactory improvement then a course of Prednisolone should then be considered.
