PRESENTING CLINICAL SIGNS

History: P presented for US due to vomiting blood. rDVM ultrasound- thickening of stomach wall

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 3.4 cm, right measured 3.4 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. The kidneys have a normal color flow pattern.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 1.1 cm in length x 0.3 cm and 0.33 cm in width. The right adrenal gland measured 0.9 cm in length x 0.39 cm and 0.39 cm in width.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 0.7 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

A large, irregular, hypoechoic mass in the fundus measuring at least 2.1 x 5.8 cm in size. Normal appearance of the duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

Enlarged gastric lymph node measuring 0.6 x 1.2 cm in size. With a rounded shape and hypoechoic appearance.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Gastric mass.
- Gastric lymphadenomegaly.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most likely etiology for the gastric mass would be neoplasia such as lymphoma.

The most likely etiology for the gastric lymphadenomegaly would be infiltrative neoplasia with reactive hyperplasia and lymphadenitis a less likely differential diagnosis.

Further assessment would be FNA cytology of the gastric mass as well as the gastric lymph node.

Specific therapy would be dependent on an etiological diagnosis. Symptomatic management that can be considered would be the use of Prednisolone and gastric protectants such as Omeprazole and Sucralfate.
