PRESENTING CLINICAL SIGNS

History: Hematuria. Increased frequency -on and off hematuria. Current Meds: Cyclosporin 200mg; Zenrelia 22.5mg ; recently on Simplicef. Sedation : Gaba/Traz, Torb.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a focal, mottled echogenic mass on the apical wall measuring 1.0 x 1.7 cm in size. The rest of the wall had a normal thickness and smooth appearance. A moderate amount of floating, hyperechogenic sediment is present. No uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 6.2 cm, right measured 6.3 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is evident in both kidneys. Small, incidental cortical cysts are present in the cranial pole of the right kidney measuring 0.8 cm in size.

Adrenal Glands

Normal shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.51 cm and 0.49 cm in width. The right adrenal gland measured 0.42 cm and 0.58 cm in width.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 2.4 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Urinary bladder mass.
- Urinary bladder sediment.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Etiologies for the urinary bladder mass would be neoplasia, granuloma and possibly chronic bacterial cystitis.

Etiologies for the urinary bladder sediment would be hematuria, crystalluria and possibly bacterial cystitis.

Further assessment would be urinalysis, urine culture, BRAF analysis and/or a catheter assisted aspirate/biopsy of the urinary bladder mass with cytology/histopathology and culture.

Specific therapy would be dependent on an etiological diagnosis.

As the urinary bladder mass is on the apical wall, surgical resection should be considered.
