PRESENTING CLINICAL SIGNS

History: Chronic v+ and D+, wt loss, distended abdomen, R/O IBD/ lymphoma/ etc.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 4.0 cm, right measured 4.6 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is evident in both kidneys.

Adrenal Glands

The right adrenal gland is normal in shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Right adrenal gland measured 0.38 cm in width. The left adrenal gland was not visualized.

Spleen

Normal size and echogenic appearance. Smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident. The spleen measured 0.6 cm in width.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is small containing normal anechoic bile. Thickened and hyperechogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, small intestine, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen. A moderate amount of ingesta is present in the stomach. Chyme was present in the proximal small intestine, both compatible with a recent meal.

Pancreas

The visible sections of the pancreas are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas. The left pancreas measured 0.4 cm in width.

Free Abdomen

Normal mesenteric lymph nodes.

A scant amount of acellular ascites evident.

ULTRASONOGRAPHIC FINDINGS

- Previous cholecystitis.
- Ascites.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

On this ultrasound there is no obvious etiology for the presenting clinical signs. The most likely for the ascites would be secondary to the chronic gastrointestinal signs.

Although the GI tract appears ultrasonographically normal, with the presenting clinical signs an underlying enteropathy such as parasitic enteritis, dietary hypersensitivity, inflammatory bowel disease and exocrine pancreatic insufficiency should still be considered.

Further assessment would be fecal analysis, cobalamin, folate and TLI assay and endoscopy of the upper GI tract with biopsies.

Specific therapy would be dependent on an etiological diagnosis.

Symptomatic management that could be considered would be feeding small frequent meals of a novel protein/hypoallergenic diet, course of Fenbendazole, cobalamin supplementation and if there is still not a satisfactory improvement then a course of Prednisolone would then be indicated.
