PRESENTING CLINICAL SIGNS

- Vomiting, ADR, Stumbling
- USG-1.012 blood-1+ EOS-2,387 Amy-1,494

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The urinary bladder is full with a normal thickness and smooth appearance of the wall. Normal anechoic urine with no sediment or uroliths evident.

Normal appearance of the trigone area, proximal urethra, and iliac blood vessels.

Normal appearance and size of the iliac lymph nodes. Ureters not visualized, which can be considered a normal finding.

Normal renal size (left measured 3.6 cm, right measured 3.2 cm), architecture, echogenic appearance, cortico-medullary differentiation, which maintains a 1:3 cortex to medulla ratio, pelvis, and capsule. No infarcts, mineralization or renoliths evident. Normal color flow pattern is evident in both kidneys.

Adrenal Glands

The left adrenal gland is normal in shape, echogenic appearance, size, position, and appearance of the visible peri-adrenal vasculature. Left adrenal gland measured 0.32 cm in width. The right adrenal gland was not visualized.

Spleen

The spleen is enlarged and measured 1.2 cm in width, but maintained a normal echogenic appearance, smooth homogenous parenchyma and regular curvilinear capsule. Normal volume of the splenic vasculature without any overt congestion or thrombosis evident. No inflammatory, neoplastic, infarction, or infiltrative changes evident.

Liver

Normal size, echogenic appearance, portal markings, and regular curvilinear capsule. No nodules or masses evident. Normal appearance of the hepatic and portal vasculature.

Gallbladder

The gallbladder is full containing normal anechoic bile. Normal thickness and echogenic appearance of the wall. Normal size and appearance of the cystic and common bile duct.

Gastrointestinal

Normal appearance of the stomach, duodenum, ileo-cecal junction, and colon with no loss of layering, 1:3 muscularis to mucosa ratio, normal wall thickness and peristaltic activity, and no distension of the lumen. Diffuse thickening of the small intestine measuring up to 0.4 cm with a marked increase in the muscularis to mucosa ratio, but showing no loss of layering.

Pancreas

The pancreas was not clearly visualized, but the visualized sections are of normal size and echogenic appearance with a regular capsule. Normal echogenic appearance of the mesentery and fat surrounding the pancreas.

Free Abdomen

Normal mesenteric lymph nodes.

No ascites evident.

Irregular, hypoechogenic, poorly vascularized mass is visible in the cranial abdomen measuring 4.0 x 4.8 cm in size.

ULTRASONOGRAPHIC FINDINGS

- Abdominal mass.
- Splenomegaly.
- Enteropathy.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The most likely etiology for the splenic mass would be neoplasia and most likely originating from the mesenteric lymph node.

With the abdominal mass, enteropathy and splenomegaly the most likely diagnosis would be lymphoma.

Further assessment would be FNA cytology of the mass and spleen.

Specific therapy would be dependent on an etiological diagnosis.
